MARKETING SWEET · INTERNAL STRATEGY · MAY 2026

We Are An AI Business.

The positioning shift, the infrastructure it requires, and the asymmetric window we're stepping into while the pricing is still wrong.

WHAT'S INSIDE

The mindset shift.

From "a company that uses AI" to "an AI business." The framing forces every internal decision through a new filter.

OLD FRAMING

"We use AI."

AI is a feature. A tool the team reaches for occasionally. Decisions made the same way they've always been made.

WHAT IT LOOKS LIKE:

- Claude used for one-off lookups.
- Data lives in inboxes, Slack, individual minds.
- Same task done differently by different people.
- Manual work treated as the default.
- Privacy instincts block AI from operating.
- Tooling-led, not architecture-led.

NEW FRAMING

"We are AI."

AI is the operating model. Every internal decision filtered through "does this help the AI do its work, or get in its way?"

WHAT IT LOOKS LIKE:

- Claude embedded into vertical workflows.
- Centralised database is the source of truth.
- Same task = same script, every time.
- Manual work treated as a bug to be fixed.
- Efficiency wins over privacy instincts.
- Architecture-led. Tooling follows.

THE TEST

Every decision should answer: does this help the AI do its work, or does it get in the way? If it gets in the way, change the decision.

Reframe — AI is the best employee money could buy.

Stop comparing Claude to Microsoft or Google. Compare it to a senior employee — at a fraction of the cost.

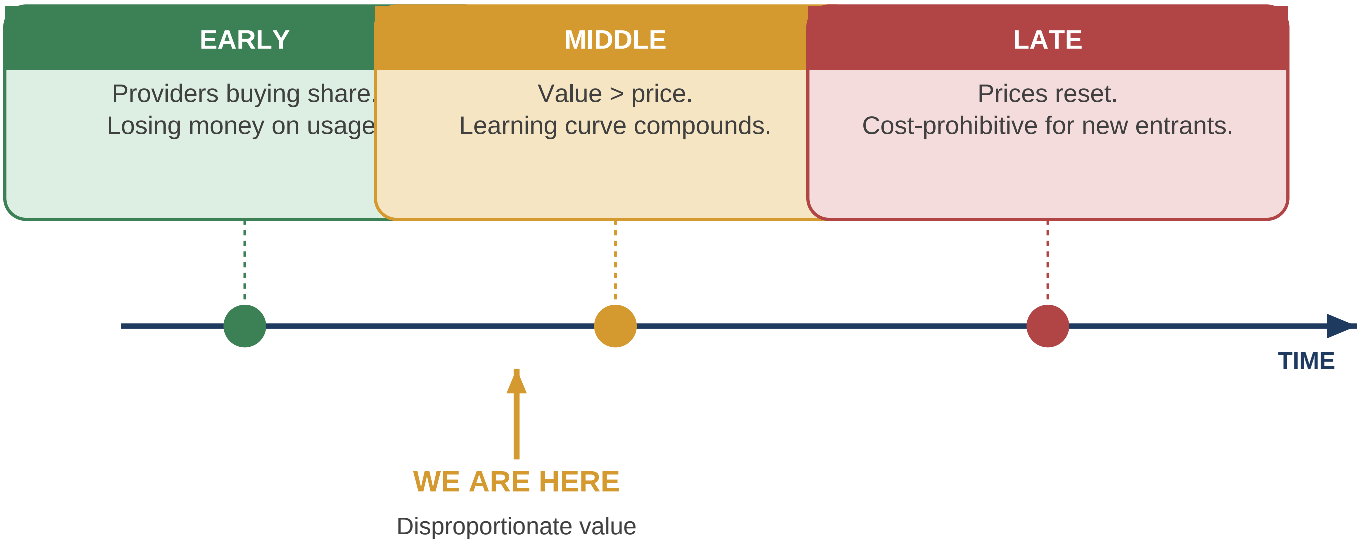
THE REFRAME

"Stop looking at Claude as a piece of software. Look at it as the best employee money could buy. Right now it's cheap. That's why we move now."

AS SOFTWARE		AS EMPLOYEE
Used for one-off questions	→	**Briefed with full context for the work**
Treated like a smart Google search	→	**Treated like a senior team member**
Used by individuals, ad-hoc	→	**Embedded into vertical processes**
Output = whatever you type	→	**Output = quality of the inputs you prepared**
Value cap = one user's typing speed	→	**Value cap = size of the database**

The asymmetric pricing window.

Cheap now. Expensive later. The pattern that repeats every technology cycle — and the window we're in.



PRIOR ANALOGUES

AdWords launched with Google losing ~70¢ on every $1 of clicks — share buying, not margin. Bitcoin at $2,000. SEO before the playbook was widely known. Every cycle: massive disproportion between price and value during the window, then a sharp reset.

WHAT TO DO WHILE THE WINDOW'S OPEN

- Burn tokens generously — build the database, run the bulk reports, prototype freely.
- Get the team up the learning curve before the price resets.
- Design the workflows assuming current pricing — but built to absorb future increases.

Every client is a patient chart.

The medical-record metaphor. Every team member who walks up to the bed pulls the chart and sees the vital info first.

CLIENT CHART

PRIORITY ORDER · VITAL SIGNS FIRST

01 VITAL SIGNS	Campaign structure, current performance, any flags or alerts.
02 IDENTITY	Business name, industry, location, contact, decision-maker.
03 HISTORY	Engagement history, previous work, pitched vs delivered.
04 CONTEXT	Competitors, competitor locations, competitor spend, market position.
05 DIAGNOSTICS	Keyword performance, backlink profile, FAQ coverage, audit history.
06 PRESCRIPTIONS	Recommended products, flagged upsells, scheduled re-checks.

THE RULE

Anything not in the chart might as well not exist. The richer the chart, the better the AI's output.

Vertical operations.

McDonald's not à la carte. We have McDonald's-level volume — but we still cook every dish in a new pan.

À LA CARTE · TODAY

Each client treated as bespoke. Each task started from scratch. Each report built one at a time.

WHAT THIS COSTS:

- Repeated effort across similar clients.
- Insights stay trapped per-engagement.
- Scaling has linear cost, not leverage.
- Patterns across the book never surface.

STATION + CONVEYOR · NEXT

Identical processes batched across similar clients. One script, every plumber. One audit, every backlink.

WHAT THIS UNLOCKS:

- One pass updates the whole book.
- Patterns across clients become visible.
- Cost per client drops sharply.
- New ideas ship across the book instantly.

BATCHES TO BUILD FIRST

- Backlink audits across the full client list — find gaps + bad backlinks.
- FAQ coverage audit — 30 have them, the rest don't. One upsell campaign, one pass.
- Competitor analysis as a scheduled job — runs against every account every month.
- Industry-grouped audits — all plumbers together, all landscapers together.

The proprietary stack.

Standard AI underneath. Our system on top. Like WordPress — the differentiation is the assembly, not the base.

OUR PROPRIETARY LAYERS

LAYER 5 · CLIENT SURFACE

Reports. Recommendations. Upsells. The relationship layer.

LAYER 4 · SCHEDULING / ROUTING

Which script runs against which client, when, and why.

LAYER 3 · MASTER DATABASES

Client charts. Backlink master. Keyword master. Audit history.

LAYER 2 · SCRIPT LIBRARY

Categorised. Reusable. Chainable. The unit of work.

LAYER 1 · BASE AI

Claude, ChatGPT, whichever model serves the job. Commodity.

WHERE THE MOAT IS

Competitors sit at Layer 1 — same model, generic prompts. Our advantage compounds at Layers 2 to 5. Those layers are not easily copied.

Next steps + the operating principles.

What to build first. The rules to operate by while the window's open.

BUILD NEXT · THIS QUARTER

01 Stand up the centralised client database.
One source of truth. One patient chart per client. The foundation.

02 Build the URL-to-product tool.
First end-to-end script chain. Proof of concept for everything that follows.

03 Consolidate the backlink history.
First master database. Tagged by client and by industry.

04 Write the next three high-value scripts.
Re-engagement. Scheduled audit. Competitor delta. Assign owners.

05 Establish the script library.
Categorised location. Every new script lands here, tagged for reuse.

06 Audit chart completeness.
Where the patient chart is sparse, fill it before running scripts against it.

OPERATING PRINCIPLES

- Treat AI as our best employee, not as software.
- The database is the moat. Invest in it like infrastructure.
- Burn tokens generously while the window's open.
- Vertical operations: every script runs against the whole book.
- Scripts are the unit of work. Library them. Chain them.
- Garbage in, garbage out — quality of input governs everything.
- Choose efficiency over privacy instinct, deliberately.
- Ten-year horizon. Slower than predicted, bigger than predicted.

THE ONE-LINER

We are an AI business. The database is the moat. Burn the cheap tokens. Lock in before the market catches up.
